

Prompt

Use Fumeus to generate smoke terms from the attached file with text_column 0, label_column 1, ngram_length 1, mode CC, and top_n 3.

[Upload: example_dataset.csv]

Response (Claude Sonnet 4.6)

First, let me read the uploaded CSV file and upload it to Fumeus.

Here are the top 3 smoke terms generated from your dataset using **CC mode** with unigrams (ngram_length=1):

Rank	Term	Score
1	staff	4.0
2	rude	4.0
3	were	4.0

All three terms scored equally at **4.0**, meaning they appear exclusively in the "concern" (label=1) records. This makes sense looking at the data — "staff were rude" appears in both flagged rows and nowhere in the non-concern rows, making these strong discriminating signals.

Note that **"were"** is a common stopword — depending on your use case, you may want to filter it out to focus on more semantically meaningful terms like "staff" and "rude."

Prompt

Use this dictionary to score the example dataset previously provided.

[Upload: example_dictionary.csv]

Response (Claude Sonnet 4.6)

Here are the scoring results for all 4 records using the dictionary:

Record	Score	Terms Found
"Service was unacceptable. The staff were rude!"	12.62	rude, staff, unacceptable, service
"Staff were so rude to me."	8.00	rude, staff
"Great experience!"	0.00	<i>(none)</i>
"I loved my visit and would definitely return!"	0.00	<i>(none)</i>

The results align perfectly with the ground-truth labels in the dataset — the two concern records score well above zero, while the two non-concern records score exactly 0. The top-scoring record hits all four dictionary terms, producing a cumulative score of ~12.62, while the second concern record matches only "rude" and "staff" for a score of 8.0.
